Practical application of PHOTOMOD GeoMosaic module

E.R. Babeeva, Aerogeofot ltd, Russia

Recently there emerged a necessity in our company for creation of mosaic images with limited precision (photomontage) from overlapping satellite images, scanned raster maps and plans.

For this task, our company has bought the PHOTOMOD GeoMosaic software from Racurs co.

The program is being diligently explored by our specialists, and has found wide application in obtaining high quality photomontage images from a set of georeferenced images.

In the course of exploitation of the product, the program capabilities in processing of our materials are being studied, and negotiation are conducted with the developers about additional features.

The report covers the results of this analysis and examples of various photomontage projects.
